# Pick your Poison

All of these counterfactuals are valid explanations for the model's prediction.

*Which one would you pick?*

Figure 1: Turning a 9 into a 7: Counterfactual explanations for an image classifier produced using *Wachter* (Wachter, Mittelstadt, and Russell 2017), *Schut* (Schut et al. 2021) and *REVISE* (Joshi et al. 2019).

Faithfulness first, plausibility second.

# Faithfulness first, plausibility second.

We propose *ECCCo*: a new way to generate faithful model explanations that are as plausible as the underlying model permits.

# Summary

- **Idea:** generate counterfactuals that are consistent with what the model has learned about the data.

# Summary

- **Idea:** generate counterfactuals that are consistent with what the model has learned about the data.
- **Method:** constrain the model's energy and predictive uncertainty for the counterfactual.

# Summary

- **Idea:** generate counterfactuals that are consistent with what the model has learned about the data.
- **Method:** constrain the model's energy and predictive uncertainty for the counterfactual.
- **Result:** faithful counterfactuals that are as plausible as the model permits.

# Summary

- **Idea:** generate counterfactuals that are consistent with what the model has learned about the data.
- **Method:** constrain the model's energy and predictive uncertainty for the counterfactual.
- **Result:** faithful counterfactuals that are as plausible as the model permits.
- **Benefits:** enable us to distinguish trustworthy from unreliable models.

# Counterfactual Explanations

$$\min_{\mathbf{Z}' \in \mathcal{Z}^L} \{y_{\text{loss}}(M_{\theta}(f(\mathbf{Z}')), \mathbf{y}^+) + \lambda \text{cost}(f(\mathbf{Z}'))\}$$

## Counterfactual Explanations (CE)

explain how inputs into a model need to change for it to produce different outputs.

Figure 2: Gradient-based counterfactual search.

# Reconciling Faithfulness and Plausibility

# Plausibility

## Definition (Plausible Counterfactuals)

Let  $\mathcal{X}|\mathbf{y}^+ = p(\mathbf{x}|\mathbf{y}^+)$  denote the true conditional distribution of samples in the target class  $\mathbf{y}^+$ . Then for  $\mathbf{x}'$  to be considered a plausible counterfactual, we need:  $\mathbf{x}' \sim \mathcal{X}|\mathbf{y}^+$ .

## Why Plausibility?

Plausibility is positively associated with actionability, robustness (Artelt et al. 2021) and causal validity (Mahajan, Tan, and Sharma 2020).

Figure 3: Kernel density estimate (KDE) for the conditional distribution,  $p(\mathbf{x}|\mathbf{y}^+)$ , based on observed data. Counterfactual path as in Figure 2.

# Faithfulness

## Definition (Faithful Counterfactuals)

Let  $\mathcal{X}_\theta|\mathbf{y}^+ = p_\theta(\mathbf{x}|\mathbf{y}^+)$  denote the conditional distribution of  $\mathbf{x}$  in the target class  $\mathbf{y}^+$ , where  $\theta$  denotes the parameters of model  $M_\theta$ . Then for  $\mathbf{x}'$  to be considered a faithful counterfactual, we need:  
 $\mathbf{x}' \sim \mathcal{X}_\theta|\mathbf{y}^+$ .

## Trustworthy Models

If the model posterior approximates the true posterior ( $p_\theta(\mathbf{x}|\mathbf{y}^+) \rightarrow p(\mathbf{x}|\mathbf{y}^+)$ ), faithful counterfactuals are also plausible.

Figure 4: KDE for learned conditional distribution,  $p_\theta(\mathbf{x}|\mathbf{y}^+)$ . Yellow stars indicate conditional samples generated through SGLD for a joint energy model (JEM).

# ECCCo

## Key Idea

Use the hybrid objective of joint energy models (JEM) and a model-agnostic penalty for predictive uncertainty: Energy-Constrained ( $\mathcal{E}_\theta$ ) Conformal ( $\Omega$ ) Counterfactuals (ECCCo).

ECCCo objective<sup>a</sup>:

$$\min_{\mathbf{Z}' \in \mathcal{Z}^L} \{L_{\text{clf}}(f(\mathbf{Z}'); M_\theta, \mathbf{y}^+) + \lambda_1 \text{cost}(f(\mathbf{Z}')) + \lambda_2 \mathcal{E}_\theta(f(\mathbf{Z}') | \mathbf{y}^+) + \lambda_3 \Omega(C_\theta(f(\mathbf{Z}'); \alpha))\}$$

Figure 5: Gradient fields and counterfactual paths for different generators.

<sup>a</sup>We leverage ideas from Grathwohl et al. (2020) and Stutz et al. (2022). See the paper and appendix for a derivation of the objective from first principles.

# Results

# Visual Evidence

Figure 6: Turning a 9 into a 7. *ECCCo* applied to MLP (a), Ensemble (b), JEM (c), JEM Ensemble (d).

*ECCCo* generates counterfactuals that

- faithfully represent model quality (Figure 6).
- achieve state-of-the-art plausibility (Figure 7).

Figure 7: Results for different generators (from 3 to 5).

# The Numbers

- Large benchmarks on a variety of models and datasets from various domains.
- *ECCCo* achieves state-of-the-art faithfulness across models and datasets and approaches state-of-the-art plausibility for more trustworthy models.
